The half-life of a given unit of a substance is 1599 years. For a substance with 0.1 grams after 10,000 years, the equation is:

\[ y = C e^{kt} \]

Taking the natural logarithm of both sides:

\[ \ln \left( \frac{1}{2} \right) = \ln e^{1599k} \]

Since \( \ln(0.5) = \ln(\frac{1}{2}) \):

\[ \frac{\ln(0.5)}{1599} = k \]

The equation for the substance at 10,000 years with 0.1 grams is:

\[ 0.1 = C e^{\left( \frac{\ln(0.5)}{1599} \right) \cdot 10000} \]

Solving for \( C \):

\[ C = \frac{0.1}{e^{\frac{\ln(0.5)}{1599} \cdot 10000}} \]

\[ C = 7.63 \]

The equation for the substance at any time \( t \):

\[ y = 7.63 e^{\frac{\ln(0.5)}{1599} \cdot t} \]

For 10,000 years:

\[ y = 7.63 e^{\frac{\ln(0.5)}{1599} \cdot 10000} \]

\[ y = 4.95 \text{ grams} \]
In Exercises 21–24, write and solve the differential equation that models the verbal statement. Evaluate the solution at the specified value of the independent variable.

21. The rate of change of $y$ is proportional to $y$. When $x = 0$, $y = 6$, and when $x = 4$, $y = 15$. What is the value of $y$ when $x = 8$?

22. The rate of change of $N$ is proportional to $N$. When $t = 0$, $N = 250$, and when $t = 1$, $N = 400$. What is the value of $N$ when $t = 4$?

23. The rate of change of $V$ is proportional to $V$. When $t = 0$, $V = 20,000$, and when $t = 4$, $V = 12,500$. What is the value of $V$ when $t = 6$?

$$V = Ce^{kt}$$

(0, 20,000)

$20,000 = Ce^0$

$20,000 = C$

$V = 20,000e^{kt}$

(4, 12,500)

$12,500 = 20,000e^{4k}$

$.625 = e^{4k}$

$\ln(.625) = 4k$

$\frac{\ln(.625)}{4} = k$

$k = \text{Constant of Proportionality}$

$$\frac{dV}{dt} = kV$$

$V = Ce^{kx}$

Let $t = 6$

$V \approx 20,000e^{-1.175t}$

$V \approx 9,882.118$
## 6.3 Separation of Variables and the Logistic Equation

- Recognize and solve differential equations that can be solved by separation of variables.
- Recognize and solve homogeneous differential equations.
- Use differential equations to model and solve applied problems.
- Solve and analyze logistic differential equations.

### Separation of Variables

Consider a differential equation that can be written in the form

$$M(x) + N(y) \frac{dy}{dx} = 0$$

where $M$ is a continuous function of $x$ alone and $N$ is a continuous function of $y$ alone. As you saw in the preceding section, for this type of equation, all $x$ terms can be collected with $dx$ and all $y$ terms with $dy$, and a solution can be obtained by integration. Such equations are said to be **separable**, and the solution procedure is called **separation of variables**. Below are some examples of differential equations that are separable.

**Original Differential Equation**

- $x^2 + 3y \frac{dy}{dx} = 0$
- $(\sin x)y' = \cos x$
- $\frac{xy'}{e^y + 1} = 2$

**Rewritten with Variables Separated**

- $3y \ dy = -x^2 \ dx$
- $dy = \cot x \ dx$
- $\frac{1}{e^y + 1} \ dy = \frac{2}{x} \ dx$
Try It 1

Solve the differential equation $y' = \frac{\sqrt{x}}{2y}$. 
Find the general solution of \( y \frac{dy}{dx} - 2e^x = 0 \).

\[
\frac{dy}{dx} = 2e^x
\]

\[
y y' = 2e^x dx
\]

\[
\frac{y^2}{2} = 2e^x + C
\]

\[
y^2 = 4e^x + 2C
\]

\[
y^2 = 4e^x + C
\]

Check

Use Implicit Diff.

\[2y \frac{dy}{dx} = 4e^x + 0\]

\[\frac{dy}{dx} = \frac{4e^x}{2y} = 2e^x \]

\[\frac{dy}{dx} = \frac{2e^x}{y} \quad \text{Check}\]
Given the initial condition \( y(1) = 0 \), find the particular solution of the equation:

\[ xy \frac{dy}{dx} - \ln x = 0 \]

Separation:

\[ xy \frac{dy}{dx} = \ln x \]

Integrate:

\[ \int y \, dy = \int \frac{\ln x}{x} \, dx \]

\[ \frac{y^2}{2} = \int u \, du \]

\[ \frac{y^2}{2} = \int \frac{u^2}{2} \, du \]

\[ 2 \left( \frac{y^2}{2} = \left( \frac{\ln(x)^2}{2} + C \right)^2 \right) \]

\[ y^2 = (\ln x)^2 + C \]

Initial Condition:

\[ 0^2 = (\ln(1))^2 + C \]

\[ 0 = 0 + C \]

\[ C = 0 \]

\[ \frac{y^2}{2} = (\ln x)^2 \]

\[ y = \pm \sqrt{(\ln x)^2} \]

\[ y = \pm |\ln x| \]

\[ y = \pm \ln x \]

\[ y = \pm \ln x \]

Check:

Implicit Diff.

\[ 2y \frac{dy}{dx} = 2(\ln x) \left( \frac{1}{x} \right) \]

\[ \frac{dy}{dx} = \frac{2 \ln(x)}{2 \cdot xy} \]
Find the equation of the curve $s(r)$ that passes through the point $(1, 0)$ and has a slope of $e^{r+s}$ at the point $(s, r)$ as shown.

\[
\frac{dr}{ds} = e^{r+s} = e^r \cdot e^s
\]
In some cases it is not feasible to write the general solution in the explicit form \( y = f(x) \). The next example illustrates such a solution. Implicit differentiation can be used to verify this solution.

**EXAMPLE 2** Finding a Particular Solution

Given the initial condition \( y(0) = 1 \), find the particular solution of the equation

\[
xy \, dx + e^{-x^2} (y^2 - 1) \, dy = 0.
\]

**Solution** Note that \( y = 0 \) is a solution of the differential equation—but this solution does not satisfy the initial condition. So, you can assume that \( y \neq 0 \). To separate variables, you must rid the first term of \( y \) and the second term of \( e^{-x^2} \). So, you should multiply by \( e^{x^2}/y \) and obtain the following.

\[
xy \, dx + e^{-x^2} (y^2 - 1) \, dy = 0
\]

\[
e^{-x^2} (y^2 - 1) \, dy = -xy \, dx
\]

\[
\int \left( y - \frac{1}{y} \right) \, dy = \int -xe^{x^2} \, dx
\]

\[
\frac{y^2}{2} - \ln |y| = -\frac{1}{2}e^{x^2} + C
\]

From the initial condition \( y(0) = 1 \), you have \( \frac{1}{2} - 0 = -\frac{1}{2} + C \), which implies that \( C = 1 \). So, the particular solution has the implicit form

\[
\frac{y^2}{2} - \ln |y| = -\frac{1}{2}e^{x^2} + 1
\]

\[
y^2 - \ln y^2 + e^{x^2} = 2.
\]

You can check this by differentiating and rewriting to get the original equation.
EXAMPLE 3 Finding a Particular Solution Curve

Find the equation of the curve that passes through the point (1, 3) and has a slope of \( y/x^2 \) at any point \((x, y)\).

Solution  Because the slope of the curve is given by \( y/x^2 \), you have

\[
\frac{dy}{dx} = \frac{y}{x^2}
\]

with the initial condition \( y(1) = 3 \). Separating variables and integrating produces

\[
\int \frac{dy}{y} = \int \frac{dx}{x^2}, \quad y \neq 0
\]

\[
\ln|y| = -\frac{1}{x} + C_1
\]

\[
y = e^{-1/x} + C_1 = Ce^{-1/x}.
\]

Because \( y = 3 \) when \( x = 1 \), it follows that \( 3 = Ce^{-1} \) and \( C = 3e \). So, the equation of the specified curve is

\[
y = (3e)e^{-1/x} = 3e^{x-1/x}, \quad x > 0.
\]

Because the solution is not defined at \( x = 0 \) and the initial condition is given at \( x = 1 \), \( x \) is restricted to positive values. See Figure 6.12.
Applications

EXAMPLE 7 Wildlife Population

The rate of change of the number of coyotes \( N(t) \) in a population is directly proportional to \( 650 - N(t) \), where \( t \) is the time in years. When \( t = 0 \), the population is 300, and when \( t = 2 \), the population has increased to 500. Find the population when \( t = 3 \).

**Solution** Because the rate of change of the population is proportional to \( 650 - N(t) \), you can write the following differential equation.

\[
\frac{dN}{dt} = k(650 - N)
\]

You can solve this equation using separation of variables.

\[
\int \frac{dN}{650 - N} = \int k \, dt
\]

\[
\ln|650 - N| = kt + C_1
\]

\[
650 - N = e^{kt}e^{-C_1}
\]

\[
N = 650 - Ce^{-kt}
\]

Using \( N = 300 \) when \( t = 0 \), you can conclude that \( C = 350 \), which produces

\[
N = 650 - 350e^{-kt}
\]

Then, using \( N = 500 \) when \( t = 2 \), it follows that

\[
500 = 650 - 350e^{-2k} \quad \Rightarrow \quad e^{-2k} = \frac{1}{2} \quad \Rightarrow \quad k = 0.4236.
\]

So, the model for the coyote population is

\[
N = 650 - 350e^{-0.4236t}
\]

When \( t = 3 \), you can approximate the population to be

\[
N = 650 - 350e^{-0.4236(3)} = 552 \text{ coyotes}
\]

The model for the population is shown in Figure 6.14. Note that \( N = 650 \) is the horizontal asymptote of the graph and is the *carrying capacity* of the model. You will learn more about carrying capacity later in this section.
A common problem in electrostatics, thermodynamics, and hydrodynamics involves finding a family of curves, each of which is orthogonal to all members of a given family of curves. For example, Figure 6.15 shows a family of circles

\[ x^2 + y^2 = C \]  

Family of circles

each of which intersects the lines in the family

\[ y = Kx \]  

Family of lines

at right angles. Two such families of curves are said to be mutually orthogonal, and each curve in one of the families is called an orthogonal trajectory of the other family. In electrostatics, lines of force are orthogonal to the \textit{equipotential curves}. In thermodynamics, the flow of heat across a plane surface is orthogonal to the \textit{isothermal curves}. In hydrodynamics, the flow (stream) lines are orthogonal trajectories of the \textit{velocity potential curves}.

Each line \( y = Kx \) is an orthogonal trajectory of the family of circles.

Figure 6.15
Describe the orthogonal trajectories for the family of curves given by $2x^2 - y^2 = C$ for $C \neq 0$. Sketch several members of each family.

The slope of the family of orthogonal trajectories is the negative reciprocal.

\[
\frac{dy}{dx} = \frac{2x}{y}
\]

Slope of Orthogonal Trajectories

New family

\[
\frac{dy}{dx} = \frac{-y}{2x}
\]

\[
\int \frac{dy}{y} = \int \frac{-1}{2x} \, dx
\]

\[
-\ln|y| = \frac{1}{2} \ln|x| + C
\]

\[
2 \ln|y| = -\ln|x| + \ln C
\]

\[
\ln|y^2| = \ln \left(\frac{1}{2} \ln|x| + \ln C\right)
\]

\[
y^2 = e^{\ln \left(\frac{1}{2} \ln|x| + \ln C\right)}
\]

\[
y^2 = k \cdot \frac{1}{x}
\]

Orthogonal Trajectories

\[
y = \frac{k}{x}
\]

\[
\pm \sqrt{k}
\]
Logistic Differential Equation

In Section 6.2, the exponential growth model was derived from the fact that the rate of change of a variable \( y \) is proportional to the value of \( y \). You observed that the differential equation \( \frac{dy}{dt} = ky \) has the general solution \( y = Ce^{kt} \). Exponential growth is unlimited, but when describing a population, there often exists some upper limit \( L \) past which growth cannot occur. This upper limit \( L \) is called the carrying capacity, which is the maximum population \( y(t) \) that can be sustained or supported as time \( t \) increases. A model that is often used to describe this type of growth is the logistic differential equation

\[
\frac{dy}{dt} = ky \left( 1 - \frac{y}{L} \right)
\]

where \( k \) and \( L \) are positive constants. A population that satisfies this equation does not grow without bound, but approaches the carrying capacity \( L \) as \( t \) increases.

From the equation, you can see that if \( y \) is between 0 and the carrying capacity \( L \), then \( \frac{dy}{dt} > 0 \), and the population increases. If \( y \) is greater than \( L \), then \( \frac{dy}{dt} < 0 \), and the population decreases. The graph of the function \( y \) is called the logistic curve, as shown in Figure 6.17.

Note that as \( t \to \infty \), \( y \to L \).

Figure 6.17

**EXAMPLE 9** Deriving the General Solution

Solve the logistic differential equation \( \frac{dy}{dt} = ky \left( 1 - \frac{y}{L} \right) \)

**Solution** Begin by separating variables.

\[
\frac{1}{y(1 - y/L)} \frac{dy}{dt} = kdt
\]

\[
\int \frac{1}{y(1 - y/L)} dy = \int kdt
\]

\[
\frac{1}{y} + \frac{1}{L - y} \frac{dy}{dt} = \int kdt
\]

\[
\ln|y| - \ln|L - y| = kt + C
\]

\[
\ln\left|\frac{L - y}{y} \right| = -kt - C
\]

\[
\frac{L - y}{y} = e^{-kt - C} = e^{-C}e^{-kt}
\]

\[
\frac{L - y}{y} = be^{-kt}
\]

Solving this equation for \( y \) produces \( y = \frac{L}{1 + be^{-kt}} \).

From Example 9, you can conclude that all solutions of the logistic differential equation are of the general form

\[
y = \frac{L}{1 + be^{-kt}}.
\]
Try It 9

Solve the logistic differential equation \( \frac{dy}{dt} = 2y \left( 1 - \frac{y}{20} \right) \).

Solution

Begin by separating variables.

\[
\frac{dy}{y(1 - y/20)} = 2 \, dt
\]

Separate variables.

\[
\int \frac{1}{y(1 - y/20)} \, dy = \int 2 \, dt
\]

Integrate each side.

\[
\int \left( \frac{1}{y} + \frac{1}{20-y} \right) \, dy = \int 2 \, dt
\]

Rewrite left side using partial fractions.

\[
\ln|y| - \ln|20 - y| = 2t + C
\]

Find antiderivative of each side.

\[
\ln \left| \frac{20 - y}{y} \right| = -2t - C
\]

Multiply each side by \(-1\) and simplify.

\[
\left| \frac{20 - y}{y} \right| = e^{-2t-C} = e^{-C}e^{-2t}
\]

Exponentiate each side.

\[
\frac{20 - y}{y} = be^{-2t}
\]

Let \( e^{-C} = b \).

Solving this equation for \( y \) produces \( y = \frac{20}{1 + be^{-2t}} \).
Try It 10

A state game commission releases 28 deer into a game refuge. After 3 years, the deer population is 60. The commission believes that the environment can support no more than 2800 deer. The growth rate of the deer population \( p \) is

\[
\frac{dp}{dt} = kp \left( 1 - \frac{p}{2800} \right), \quad 28 \leq p \leq 2800
\]

where \( t \) is the number of years.

a. Write a model for the deer population in terms of \( t \).

b. Graph the slope field of the differential equation and the solution that passes through the point \((0, 28)\).

c. Use the model to estimate the deer population after 8 years.

d. Find the limit of the model at \( t \to \infty \).

Solution

a. You know that \( L = 2800 \). So, the solution of the equation is of the form

\[
p = \frac{2800}{1 + be^{-kt}}
\]

Because \( p(0) = 28 \), you can solve for \( b \) as shown.

\[
28 = \frac{2800}{1 + be^{-480}} \Rightarrow b = 99
\]

Then, because \( p = 60 \) when \( t = 3 \), you can solve for \( k \).

\[
60 = \frac{2800}{1 + 99e^{-3k}} \Rightarrow k \approx 0.258
\]

So, a model for the deer population is given by

\[
p = \frac{2800}{1 + 99e^{-0.258t}}
\]

b. Using a graphing utility, you can graph the slope field of

\[
\frac{dp}{dt} = 0.258p \left( 1 - \frac{p}{2800} \right)
\]

and the solution passes through \((0, 28)\) as shown in the graph below.

\[\text{Graph showing slope field and solution line.}\]

c. To estimate the deer population after 8 years, substitute 8 for \( t \) in model

\[
p = \frac{2800}{1 + 99e^{-0.258(8)}} \approx 206
\]

Substitute 8 for \( t \).

Simplify.

d. As \( t \) increases without bound, the denominator of \( \frac{2800}{1 + 99e^{-0.258t}} \) gets closer to 1.

\[
\lim_{t \to \infty} \frac{2800}{1 + 99e^{-0.258t}} = 2800.
\]

Approach Zero
In Exercises 1–14, find the general solution of the differential equation.

1. \( \frac{dx}{dy} = \frac{2}{y} \)
2. \( \frac{dy}{dx} = \frac{3x^2}{y^2} \)
3. \( x^2 + 3y \frac{dx}{dy} = 0 \)
4. \( \frac{dy}{dx} = \frac{x^2 - 3}{6y^2} \)
5. \( \frac{dr}{ds} = 0.75r \)
6. \( \frac{dr}{ds} = 0.75r \)
7. \( (2 + x)y' = 3y \)
8. \( xy' = y \)
9. \( yy' = 4 \sin x \)
10. \( yy' = -8 \cos (\pi x) \)
11. \( \sqrt{1 - 4x^2} \ y' = x \)
12. \( \sqrt{x^2 - 16} \ y' = 11x \)
13. \( y \ln x - xy' = 0 \)
14. \( 12yy' - 7e^x = 0 \)

In Exercises 15–24, find the particular solution that satisfies the initial condition.

\]

60. The rate of change of \( y \) with respect to \( x \) is proportional to the difference between \( x \) and 4.

61. The rate of change of \( y \) with respect to \( x \) is proportional to the product of \( y \) and the difference between \( y \) and 4.

62. The rate of change of \( y \) with respect to \( x \) is proportional to \( y^2 \).

63. Weight Gain  A calf that weighs 60 pounds at birth gains weight at the rate \( \frac{dw}{dt} = k(1200 - w) \), where \( w \) is weight in pounds and \( t \) is time in years. Solve the differential equation.

(a) Use a computer algebra system to solve the differential equation for \( k = 0.8 \), 0.9, and 1. Graph the three solutions.

(b) If the animal is sold when its weight reaches 800 pounds, find the time of sale for each of the models in part (a).

(c) What is the maximum weight of the animal for each of the models?

64. Weight Gain  A calf that weighs \( w_0 \) pounds at birth gains weight at the rate \( \frac{dw}{dt} = 1200 - w \), where \( w \) is weight in pounds and \( t \) is time in years. Solve the differential equation.

In Exercises 65–78, find the orthogonal trajectories of the family. Use a graphing utility to graph several members of each family.

65. \( x^2 + y^2 = C \)

66. \( x^2 - 2y^2 = C \)

67. \( x^2 = Cy \)

68. \( y^2 = 2Cx \)

69. \( y^2 = Cx^2 \)

70. \( y = Ce^t \)

In Exercises 71–74, match the logistic equation with its graph. [The graphs are labeled (a), (b), (c), and (d).]

71. \( y = \frac{12}{1 + e^{-x}} \)

72. \( y = \frac{12}{1 + 3e^{-x}} \)

73. \( y = \frac{12}{1 + e^{-2x}} \)

74. \( y = \frac{12}{1 + e^{-3x}} \)
In Exercises 75 and 76, the logistic equation models the growth of a population. Use the equation to (a) find the value of \( k \), (b) find the carrying capacity, (c) find the initial population, (d) determine when the population will reach 80% of its carrying capacity, and (e) write a logistic differential equation that has the solution \( P(t) \).

75. \( P(t) = \frac{2000}{1 + 29e^{-0.75t}} \)

76. \( P(t) = \frac{5000}{1 + 39e^{-0.3t}} \)

83. In Exercises 77 and 78, the logistic differential equation models the growth rate of a population. Use the equation to (a) find the value of \( k \), (b) find the carrying capacity, (c) graph a slope field using a computer algebra system, and (d) determine the value of \( P \) at which the population growth rate is the greatest.

77. \( \frac{dP}{dt} = 3P \left( 1 - \frac{P}{100} \right) \)

78. \( \frac{dP}{dt} = 0.1P - 0.0004P^2 \)

In Exercises 79–82, find the logistic equation that satisfies the initial condition.

83. **Endangered Species** A conservation organization releases 25 Florida panthers into a game preserve. After 2 years, there are 39 panthers in the preserve. The Florida preserve has a carrying capacity of 200 panthers.

(a) Write a logistic equation that models the population of panthers in the preserve.

(b) Find the population after 5 years.

(c) When will the population reach 100?

(d) Write a logistic differential equation that models the growth rate of the panther population. Then repeat part (b) using Euler’s Method with a step size of \( h = 1 \). Compare the approximation with the exact answers.

(e) At what time is the panther population growing most rapidly? Explain.

84. **Bacteria Growth** At time \( t = 0 \), a bacterial culture weighs 1 gram. Two hours later, the culture weighs 4 grams. The maximum weight of the culture is 20 grams.

(a) Write a logistic equation that models the weight of the bacterial culture.

(b) Find the culture’s weight after 5 hours.

(c) When will the culture’s weight reach 18 grams?

(d) Write a logistic differential equation that models the growth rate of the culture’s weight. Then repeat part (b) using Euler’s Method with a step size of \( h = 1 \). Compare the approximation with the exact answers.

(e) At what time is the culture’s weight increasing most rapidly? Explain.

85. In your own words, describe how to recognize and solve differential equations that can be solved by separation of variables.

86. State the test for determining if a differential equation is homogeneous. Give an example.

87. In your own words, describe the relationship between two families of curves that are mutually orthogonal.

88. Suppose the growth of a population is modeled by a logistic equation. As the population increases, its rate of growth decreases. What do you think causes this to occur in real-life situations such as animal or human populations?

90. **Sailing** Ignoring resistance, a sailboat starting from rest accelerates \( \frac{dv}{dt} \) at a rate proportional to the difference between the velocities of the wind and the boat.

(a) The wind is blowing at 20 knots, and after 1 half-hour the boat is moving at 10 knots. Write the velocity \( v \) as a function of time \( t \).

(b) Use the result of part (a) to write the distance traveled by the boat as a function of time.

**True or False?** In Exercises 91–94, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

91. The function \( y = 0 \) is always a solution of a differential equation that can be solved by separation of variables.

92. The differential equation \( y' = xy - 2y + x - 2 \) can be written in separated variables form.

93. The function \( f(x, y) = x^2 - 4xy + 6y^2 + 1 \) is homogeneous.

94. The families \( x^2 + y^2 = 2C \) and \( x^2 + y^2 = 2Kx \) are mutually orthogonal.

**PUTNAM EXAM CHALLENGE**

95. A not uncommon calculus mistake is to believe that the product rule for derivatives says that \( (fg)' = f'g'. \) If \( f(x) = e^x \), determine, with proof, whether there exists an open interval \((a, b)\) and a nonzero function \( g \) defined on \((a, b)\) such that this wrong product rule is true for \( x \) in \((a, b)\).
